-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☐ Responsive to communication(s) filed on \_\_\_\_.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-32 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-32 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date 1-5-04.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_.

## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 3-6, and 8-12 are rejected under 35 U.S.C. 102(b) as being anticipated by Tadashi et al. (Japan 10-324969).

Regarding claims 1, Tadashi et al. teach a method of depositing metallic layers on a substrate comprising introducing argon gas into a vacuum chamber proximate a metal target. Power is supplied to the metal target and the RF coil in the presence of argon to form a very thin aluminum film on the substrate. After that electric power to the target is stopped and oxygen or nitrogen gas other than argon gas is introduced into the vacuum chamber and the aluminum film is oxidized or nitrided with the plasma by the RF coil. (See Machine Translation paragraph 0006)

Regarding claims 3, From Fig. 1 the second gas is introduced proximate the upper surface of the substrate. (See Fig. 1; Here oxygen).

Regarding claims 4, power is applied to the target and coil to initiate plasma. (See Machine Translation paragraph 0006)

Regarding claims 5, the second gas can be introduced in a metallic deposition step. The reactant gas is introduced simultaneously for reactant sputtering. (See Machine Translation paragraph 0006)

Regarding claim 6, the first gas argon is introduced in a gas stabilization step.  
(See Machine Translation paragraph 0006)

Regarding claim 8, the first gas is argon. (See Machine Translation paragraph 0006)

Regarding claim 9, the second gas can be nitrogen. (See Machine Translation paragraph 0006)

Regarding claim 10, the first gas is the inert gas argon. (See Machine Translation 0006)

Regarding claim 11, the second gas is an active gas such as oxygen or nitrogen.  
(See Machine Translation 0006)

Regarding claim 12, the second gas is introduced after power has been applied to the target and the coil. (See Machine Translation 0006)

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was

Art Unit: 1753

not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-6 and 8-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Maniv et al. (U.S. Pat. 4,392,931).

Tadashi is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The difference not yet discussed is biasing the substrate (Claim 2).

Regarding claim 2, Maniv et al. teach utilizing RF energy applied to the substrate to cause transparencies of oxide films to be increased. (Column 3 lines 43-59)

The motivation for utilizing an RF bias to the substrate is that it allows for increasing transparencies of the deposited film. (Column 3 lines 43-59)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by utilizing an Rf bias to the substrate because it allows for increasing the transparency of the film.

Claims 1, 3-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Lantsman (U.S. Pat. 5,830,330).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The difference not yet discussed is the ramping of the power to the target and coil. (Claim 7)

Regarding claim 7, Lantsman teach in Fig. 3 ramping the power to the target and coil to perform sputtering. (See Fig. 3)

The motivation for ramping the powers to the coil and target is that it allows for sustaining the plasma at low pressures. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by ramping the power to the coil and target as taught by Lantsman because it allows for sustaining the plasma at low pressures.

Claims 1, 3-6 and 8-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Ngan (EP 0 840 351).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The differences not yet discussed are where the target is made of titanium, tantalum or tungsten (Claim 13) and where the coil is made of titanium, tantalum and tungsten (Claim 14).

Regarding claims 13 and 14, Ngan teach utilizing a target and coil made of titanium. (Column 12 lines 40-43)

The motivation for utilizing a target and coil made of a material such as titanium is that it allows for depositing a layer more uniformly. (Column 9 lines 5-8)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by utilizing a target and coil

made of titanium as taught by Ngan because it allows for depositing a layer more uniformly.

Claims 1, 3-6, 8-12, 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Sone (U.S. Pat. 6,451,184).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The differences not yet discussed is where the first gas creates a higher partial pressure of first gas proximate to the sputtering target than at the upper surface of the substrate (Claim 15) and where the second gas creates a higher partial pressure of second gas proximate to the surface of the substrate than at the upper surface of the target (Claim 16).

Regarding claims 15 and 16, since Tadashi et al. teach locating the argon proximate the target in Fig. 1 and locating the oxygen gas proximate the substrate in Fig. 1 the apparatus would have inherently higher partial pressures of argon proximate the target and higher partial pressures of oxygen proximate the substrate. (See Fig. 1) Sone further teaches partitioning the gas space such that reactive gas is contained between the partition member and the substrate and the sputter gas is maintained between the target and the partition member. This keeps the partial pressure of reactive gas higher at the substrate surface than at the target surface and keeps the partial pressure of argon gas higher at the target surface than at the substrate surface. (See Abstract) Furthermore, Sone recognizes that the prior art has attempted to keep

Art Unit: 1753

the sputtering gas confined to the target and the reactive gas confined to the substrate.

(Column 2 lines 17-22)

The motivation for utilizing a high sputtering gas pressure at the target and a higher reactive gas pressure at the substrate is that it allows for production of compound films with in-plane uniform thickness and optical and electrical characteristics. (Column 3 lines 22-25)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by utilizing a high sputtering gas pressure at the target and a higher reactive gas pressure at the substrate as taught by Sone because it allows for production of compound films with in-plane uniform thickness and optical and electrical.

Claims 1, 3-6, 8-12, and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Gilboa et al. (U.S. Pat. 5,108,569).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The difference between Tadashi et al. and the present claims is the use of a shield ring and shield support member.

Regarding claim 17, Gilboa et al. teach a shield ring and shield support member in Fig. 2 such that when the shield ring is supported by the substrate support member a gas can be introduced to the upper surface of the substrate. (See Gilboa et al. Fig. 2)

The motivation for utilizing a shield ring and shield support member is that it allows for clamping the wafer to the substrate support. (Column 8 lines 37-38)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by utilizing a shield ring and support member as taught by Gilboa et al. because it allows for clamping the wafer to the substrate support.

Claims 1, 3-6, 8-12 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Chikako et al. (Japan 06-041733)

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The difference between Tadashi et al. and the present claims is the introduction of reactive gas through the central portion of the substrate holder.

Regarding claim 18, Chikako et al. teach introducing reactive gas through the center of a substrate holder. (See Abstract; Figure 1)

The motivation introducing the reactive gas through the center of the substrate is that it allows for suppressing reaction products from building up on the surface of the target. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by utilizing a reactive gas inlet at the center of the substrate holder as taught by Chikako et al. because it allows for suppressing reaction products from building up on the surface of the target.

Claims 19, 21 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Sone (U.S. Pat. 6,451,184).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The differences not yet discussed is where the first gas creates a higher partial pressure of first gas proximate to the sputtering target than at the upper surface of the substrate and where the second gas creates a higher partial pressure of second gas proximate to the surface of the substrate than at the upper surface of the target.

Since Tadashi et al. teach locating the argon proximate the target in Fig. 1 and locating the oxygen gas proximate the substrate in Fig. 1 the apparatus would have inherently higher partial pressures of argon proximate the target and higher partial pressures of oxygen proximate the substrate. (See Fig. 1) Sone further teaches partitioning the gas space such that reactive gas is contained between the partition member and the substrate and the sputter gas is maintained between the target and the partition member. This keeps the partial pressure of reactive gas higher at the substrate surface than at the target surface and keeps the partial pressure of argon gas higher at the target surface than at the substrate surface. (See Abstract) Furthermore, Sone recognizes that the prior art has attempted to keep the sputtering gas confined to the target and the reactive gas confined to the substrate. (Column 2 lines 17-22)

The motivation for utilizing a high sputtering gas pressure at the target and a higher reactive gas pressure at the substrate is that it allows for production of

Art Unit: 1753

compound films with in-plane uniform thickness and optical and electrical characteristics. (Column 3 lines 22-25)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by utilizing a high sputtering gas pressure at the target and a higher reactive gas pressure at the substrate as taught by Sone because it allows for production of compound films with in-plane uniform thickness and optical and electrical.

Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. in view of Sone as applied to claims 19, 21 and 26 above, and further in view of Maniv et al. (U.S. Pat. 4,392,931).

The difference not yet discussed is the biasing of the substrate. (Claim 20)

Regarding claim 20, Maniv is discussed above and teaches rf biasing the substrate. (See Maniv discussed above)

The motivation for utilizing a bias to the substrate is that it allows for increasing transparencies of the deposited film. (Column 3 lines 43-59)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized an rf bias to the substrate because it allows for increasing the transparency of the film.

Claims 22 and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. in view of Sone as applied to claims 19, 21 and 26 above, and further in view of Ngan (EP 840 351).

Art Unit: 1753

The differences not yet discussed are where the target is made of titanium, tantalum or tungsten (Claim 22) and where the coil is made of titanium, tantalum and tungsten (Claim 23).

Regarding claims 22 and 23, Ngan teach utilizing a target and coil made of titanium. (Column 12 lines 40-43)

The motivation for utilizing a target and coil made of a material such as titanium is that it allows for depositing a layer more uniformly. (Column 9 lines 5-8)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized a target and coil made of titanium as taught by Ngan because it allows for depositing a layer more uniformly.

Claim 24 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. in view of Sone as applied to claims 19, 21 and 26 above, and further in view of Gilboa et al. (U.S. Pat. 5,108,569).

The difference not yet discussed is the use of a shield ring and shield support member. (Claim 24)

Regarding claim 24, Gilboa et al. teach a shield ring and shield support member in Fig. 2 such that when the shield ring is supported by the substrate support member a gas can be introduced to the upper surface of the substrate. (See Gilboa et al. Fig. 2)

The motivation for utilizing a shield ring and shield support member is that it allows for clamping the wafer to the substrate support. (Column 8 lines 37-38)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized a shield ring and support member as taught by Gilboa et al. because it allows for clamping the wafer to the substrate support.

Claim 25 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. in view of Sone as applied to claims 19, 21 and 26 above, and further in view of Chikako et al. (Japan 06-041733).

The difference not yet discussed is the use of a central port for a reactive gas centrally disposed through a substrate holder. (Claim 25)

Regarding claim 25, Chikako et al. teach introducing reactive gas through the center of a substrate holder. (See Abstract; Figure 1)

The motivation introducing the reactive gas through the center of the substrate is that it allows for suppressing reaction products from building up on the surface of the target. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized a reactive gas inlet at the center of the substrate holder as taught by Chikako et al. because it allows for suppressing reaction products from building up on the surface of the target.

Claim 27 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Sone (U.S. Pat. 6,451,184), Ngan (EP 840 351) and Maniv et al. (U.S. Pat. 4,392,931).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al. discussed above)

The differences between Tadashi et al. and the present claims is having a higher partial pressure of argon at the target than at the substrate, having a higher partial pressure of reactive gas near the substrate than at the target, the target made of titanium, tantalum or tungsten, the coil made of titanium, tantalum or tungsten and the substrate being biased.

Regarding claim 27, Since Tadashi et al. teach locating the argon proximate the target in Fig. 1 and locating the oxygen gas proximate the substrate in Fig. 1 the apparatus would have inherently higher partial pressures of argon proximate the target and higher partial pressures of oxygen proximate the substrate. (See Fig. 1) Sone further teaches partitioning the gas space such that reactive gas is contained between the partition member and the substrate and the sputter gas is maintained between the target and the partition member. This keeps the partial pressure of reactive gas higher at the substrate surface than at the target surface and keeps the partial pressure of argon gas higher at the target surface than at the substrate surface. (See Abstract) Furthermore, Sone recognizes that the prior art has attempted to keep the sputtering gas confined to the target and the reactive gas confined to the substrate. (Column 2 lines 17-22)

The motivation for utilizing a high sputtering gas pressure at the target and a higher reactive gas pressure at the substrate is that it allows for production of compound films with in-plane uniform thickness and optical and electrical characteristics. (Column 3 lines 22-25)

Regarding claim 27, Ngan teach utilizing a target and coil made of titanium.

(Column 12 lines 40-43)

The motivation for utilizing a target and coil made of a material such as titanium is that it allows for depositing a layer more uniformly. (Column 9 lines 5-8)

Regarding claim 27, Maniv is discussed above and teaches rf biasing the substrate. (See Maniv discussed above)

The motivation for utilizing a bias to the substrate is that it allows for increasing transparencies of the deposited film. (Column 3 lines 43-59)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized a higher partial pressure of argon at the target than at the substrate, to have utilized a higher partial pressure of reactive gas near the substrate than at the target as taught by Sone to have utilized a target made of titanium and coil made of titanium as taught by Ngan and to have utilized a biased substrate as taught by Maniv et al. because it allows for depositing a layer uniformly with desired optical and electrical characteristics with increasing transparency.

Claims 28 and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. (Japan 10-324969) in view of Takehara (U.S. Pat. 5,340,459).

Tadashi et al. is discussed above and all is as applies above. (See Tadashi et al.)

The difference between Tadashi et al. and the present claims is that introducing a mixture of gas near the target and introducing a second gas near the substrate is not discussed.

Takehara teach a pipe 3 for introducing a mixture of gas near the target.

Takehara teach a pipe 4 for introducing a second gas near the substrate. (See abstract)

The motivation for utilizing a mixture of gas near the target and a second gas near the substrate is that it allows for equalizing the reaction of a reactive gas with a target material above the surface of the target. (Column 1 lines 60-63)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Tadashi et al. by introducing a mixture of gas near the target and a second gas near the substrate as taught by Takehara because it allows for equalizing the reaction of a reactive gas with a target material above the surface of the target.

Claim 30 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. in view of Takehara as applied to claims 28 and 29 above, and further in view of Maniv et al. (U.S. Pat. 4,392,931).

The difference not yet discussed is the biasing of the substrate.

Maniv is discussed above and teaches rf biasing the substrate. (See Maniv discussed above)

The motivation for utilizing a bias to the substrate is that it allows for increasing transparencies of the deposited film. (Column 3 lines 43-59)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized an rf bias to the substrate because it allows for increasing the transparency of the film.

Art Unit: 1753

Claims 31 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tadashi et al. in view of Takehara as applied to claims 28 and 29 above, and further in view of Ngan (EP 840 351).

The differences not yet discussed are where the target is made of titanium, tantalum or tungsten and where the coil is made of titanium, tantalum and tungsten.

Regarding claims 31 and 32, Ngan teach utilizing a target and coil made of titanium. (Column 12 lines 40-43)

The motivation for utilizing a target and coil made of a material such as titanium is that it allows for depositing a layer more uniformly. (Column 9 lines 5-8)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized a target and coil made of titanium as taught by Ngan because it allows for depositing a layer more uniformly.
